Fermentation is a metabolic process that produces chemical changes in organic substrates through the action of enzymes.In biochemistry, it is narrowly defined as the extraction of energy from carbohydrates in the absence of oxygen. In food production, it may more broadly refer to any process in which the activity of microorganisms brings about a desirable change to a foodstuff or beverage.

A very robust and inexpensive kinetic assay for determining rates of hydrolysis of p‐nitrophenyl phosphate by the enzyme alkaline phosphatase is presented.The reaction increases in rate with increase in pH. The enzyme is competitively inhibited by the reaction products, uncompetitively inhibited by L‐phenylalanine, and responds to the presence of two cofactors, magnesium and zinc ions.

I peptidi sono una classe dei composti chimici, le cui molecole hanno peso molecolare inferiore ai 5.000 dalton, costituiti da una catena estremamente variabile di amminoacidi uniti tra di loro attraverso un legame peptidico (o carboamidico).I peptidi più corti sono i dipeptidi, costituiti da due aminoacidi uniti da un solo legame peptidico; i polipeptidi costituiti da poche unità sono ...
