A binary code represents text, computer processor instructions, or any other data using a two-symbol system. The two-symbol system used is often "0" and "1" from the binary number system.The binary code assigns a pattern of binary digits, also known as bits, to each character, instruction, etc.For example, a binary string of eight bits can represent any of 256 possible values and can ...

A binary system is a system of two astronomical bodies which are close enough that their gravitational attraction causes them to orbit each other around a barycenter (also see animated examples).More restrictive definitions require that this common center of mass is not located within the interior of either object, in order to exclude the typical planet–satellite systems and planetary systems.

The BINARY and VARBINARY types are similar to CHAR and VARCHAR, except that they store binary strings rather than nonbinary strings.That is, they store byte strings rather than character strings. This means they have the binary character set and collation, and comparison and sorting are based on the numeric values of the bytes in the values.

Per iniziare la conversione da binario a ottale, trasforma il numero binario originale sostituendo a ogni 1 presente nei vari sottogruppi di tre elementi il valore corrispondente fra 4, 2 o 1. Per esempio, se è presente un 1 sopra al valore "4" di un gruppo, dovrai riportare il numero 4 nel risultato parziale del processo di conversione.
