Applications of biochemistry. Testing Ames test – salmonella bacteria is exposed to a chemical under question (a food additive, for example), and changes in the way the bacteria grows are measured. This test is useful for screening chemicals to see if they mutate the structure of DNA and by extension identifying their potential to cause cancer in humans.

Biology degree students are rarely required to take an analytical course that covers this concept in detail. Biochemical texts [9-12] typically offer limited coverage of the laboratory technique and biochemistry lab manuals provide detailed spectrophotometry theory but vary in the practical applications [13, 14]. We therefore believe it ...

A very robust and inexpensive kinetic assay for determining rates of hydrolysis of p-nitrophenyl phosphate by the enzyme alkaline phosphatase is presented. The reaction increases in rate with increase in pH. The enzyme is competitively inhibited by the reaction products, uncompetitively inhibited by L-phenylalanine, and responds to the presence of two cofactors, magnesium and zinc ions.

Image Source: Simply Science. Chlorophyll. Chlorophyll is the pigment molecule, which is the principal photoreceptor in the chloroplasts of most green plants. Chlorophylls consist of a porphyrin ring, which is bounded to an ion Mg²⁺, attached to a phytol chain.; Chlorophylls are very effective photoreceptors because they contain networks of alternating single and double bonds.

The urea cycle (also known as the ornithine cycle) is a cycle of biochemical reactions that produces urea (NH₂)₂CO from ammonia (NH₃). This cycle occurs in ureotelic organisms. The urea cycle converts highly toxic ammonia to urea for excretion. This cycle was the first metabolic cycle to be discovered (Hans

Krebs and Kurt Henseleit, 1932), five years before the discovery of the TCA cycle.
